# I. INTRODUCTION

# AI Compute is the new Oil

NYSE

## A $470B MARKET

| | AI Compute | Oil | Gold |
|---|---|---|---|
| Scarce | ✓ | ✓ | ✓ |
| Intrinsically valuable | ✓ | ✓ | ✓ |
| Burnable/Redeemable | ✓ | ✓ | ✗ |
| Standardized | ✗ | ✓ | ✓ |
| Considered a Commodity? | ✗ | ✓ | ✓ |

THE PROBLEM

**Standardization and divisibility prevents AI compute from being traded as a commodity.**

# Decentralized Exchanges

NYSE

## COMPUTE IS ALREADY TRADED... JUST NOT HERE

| Commodity | Regulated Exchange | Decentralized/ Unregulated |
|---|---|---|
| **Oil** | ✓ NYSE | ✗ |
| **Gold** | ✓ COMEX | ✗ |
| **Electricity** | ✓ PJM, ERCOT | ✗ |
| **GPU Compute** | ??? | Akash, io.net, vast.ai, compute.exchange |

**BIG Opportunity**

**GPU compute is already being traded. It is just happening without institutional oversight, standardization, or the NYSE.**

# II. Fundamental Perspectives and Assumptions

# The State of AI Compute

NYSE

## MARKET OVERVIEW

$15B in lost compute

70% GPU idle time

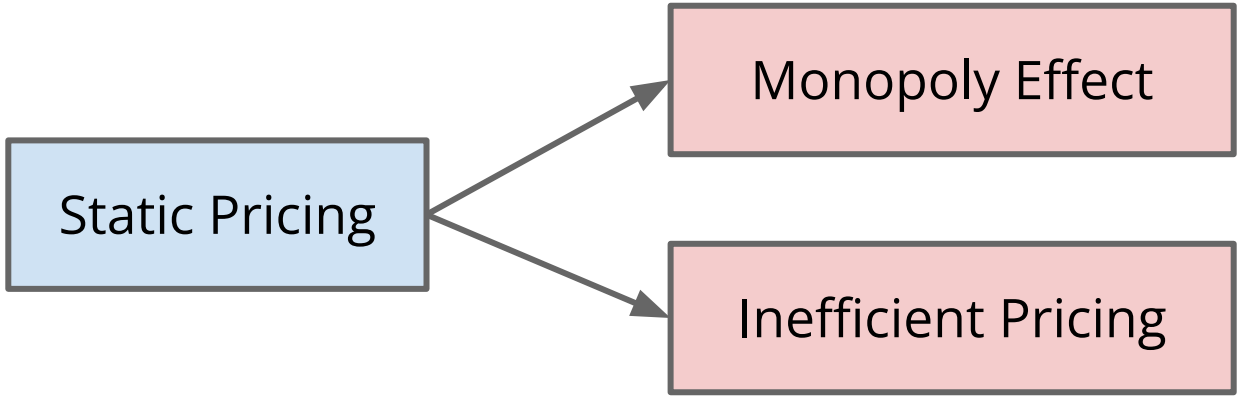

32% budget wasted on idle GPUs

**Focus has broadened from acquiring GPUs to efficient GPU utilization.**

# The State of AI Compute

NYSE

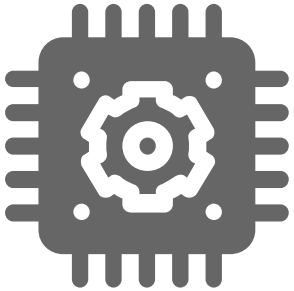

## CURRENT PRICING MODEL

**Centralized providers maintain significant price control, leading to inefficient resource allocation.**

# Unstoppable Forces and Immovable Objects

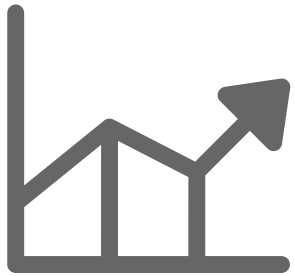

## ARBITRAGEURS VS INEFFICIENCY

**GPU usage**
***(Inefficient)***

**Combine**

**Markets**
***(Exploit inefficiencies)***

**A Characteristic of Markets**

- All market activities, including insider trading, contribute to the accurate pricing of the underlying assets and their derivatives
- Arbitrageurs close price discrepancies and are rewarded money for doing so

**To improve GPU utilization, we propose an open exchange for compute.**

# Unstoppable Forces and Immovable Objects

## EXAMPLE: BITCOIN MINING

price gap

```
if (price of GPU) < (revenue from mining Bitcoin):

    # Arbitrageur buys GPU and mines Bitcoin
    arbitrageur.buy(GPU)
    arbitrageur.mine(Bitcoin)

    # Result 1: Arbitrageur rewarded
    reward = (revenue from mining Bitcoin) - (price of GPU)
    # Result 2: Close price gap
```

# The NYSE as the Natural Fit

NYSE

## INSTITUTIONAL TRUST AT SCALE

- Lists $25T+ in market cap
- 230+ years of reputation
- Enterprises won't transact on anonymous protocols

## CLEARING INFRA ALREADY EXISTS

- ICE clears equities, futures, fixed income
- Adapting to compute escrow is an extension, not a build

## DERIVATIVES EXPERTISE

- Already administers options, swaps, futures
- GPU call options & compute swaps map directly onto existing structures

## REGULATORY MOAT

- SEC-registered with KYC/AML stack
- Decentralized competitors (Akash, io.net) cannot replicate this
- Durable structural advantage

## REVENUE DIVERSIFICATION

- Equity trading margins compressed for decades
- $470B compute market with no exchange-grade incumbent

## PROVEN PRECEDENT

- NYSE standardized REITs and commodity ETFs
- Legitimized illiquid asset classes before
- AI compute is the next frontier of that playbook

# III. Visions for a Compute Exchange

## *A. Current GPU Markets*

# Competitive Landscape

NYSE

| | Type | Launch *for Compute Services | Business Model | Target Market | Price Model | Key Differentiator |
|---|---|---|---|---|---|---|
| **Akash Network** | Decentralized cloud | 2020 | Reverse auction marketplace | Web3 developers, cost-sensitive projects | AKT token-based auctions | Sovereign blockchain, censorship-resistant |
| **io.net** | GPU aggregator | 2023 | Dynamic order-book matching | AI/ML startups, researchers | IO token or USDC | AI-specialized, Ray framework integration |
| **Coreweave** | Specialized cloud | 2017 | Enterprise GPU infrastructure | AI companies, enterprises | USD reserved/ on-demand | Enterprise-grade at 85% cost savings vs. hyperscalers |
| **Lambda** | Specialized Cloud | 2021 | Managed GPU cloud + hardware | ML researchers, enterprises | USD reserved / on demand | Integrated with popular ML frameworks |
| **Compute .Exchange** | Marketplace Aggregator | 2025 | Auction based exchange + secondary market | AI companies, enterprises | USD reverse auctions | Price transparency, resellable contracts, futures roadmap |

# Decentralized Compute Exchange

NYSE

## NYSE AS ENTERPRISE-GRADE TRUST

### The Gap

- No counterparty guarantees
- No standardized pricing
- No recourse on failure
- **No Trust**

### NYSE Opportunity

- Act as the trust layer
- Institutional stabilizer for both spot (decentralized) and derivative compute markets
- **Private companies, labs, and individuals can be providers of compute**

**A dedicated, trustworthy exchange for cloud compute in both decentralized and derivative forms.**

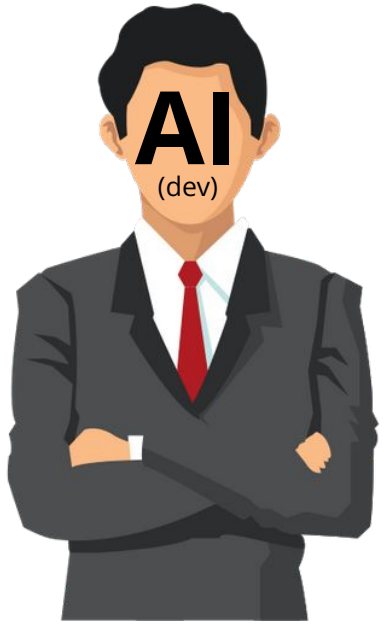

# III. Visions for a Compute Exchange

## *B. Derivative Instruments*

# Derivative Instruments

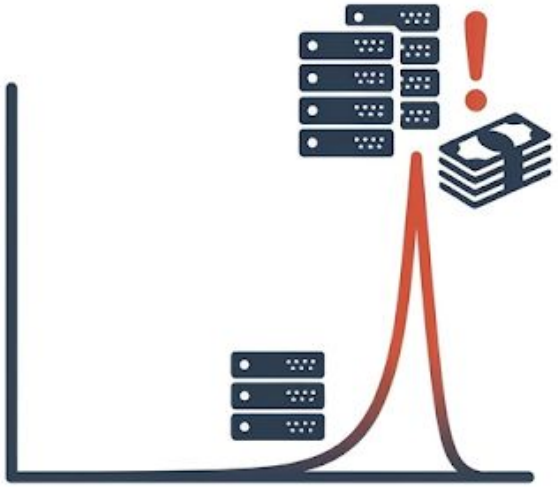

NYSE

## EXAMPLE: CALL OPTION FOR COMPUTE EXCHANGE

AI developer:
- Buys **call option**
- Cluster of **H100s**
- Strike Price: **$2/hr**

**NEW MODEL RELEASED!**
- Demand spikes
- Market price: **$6/hr**

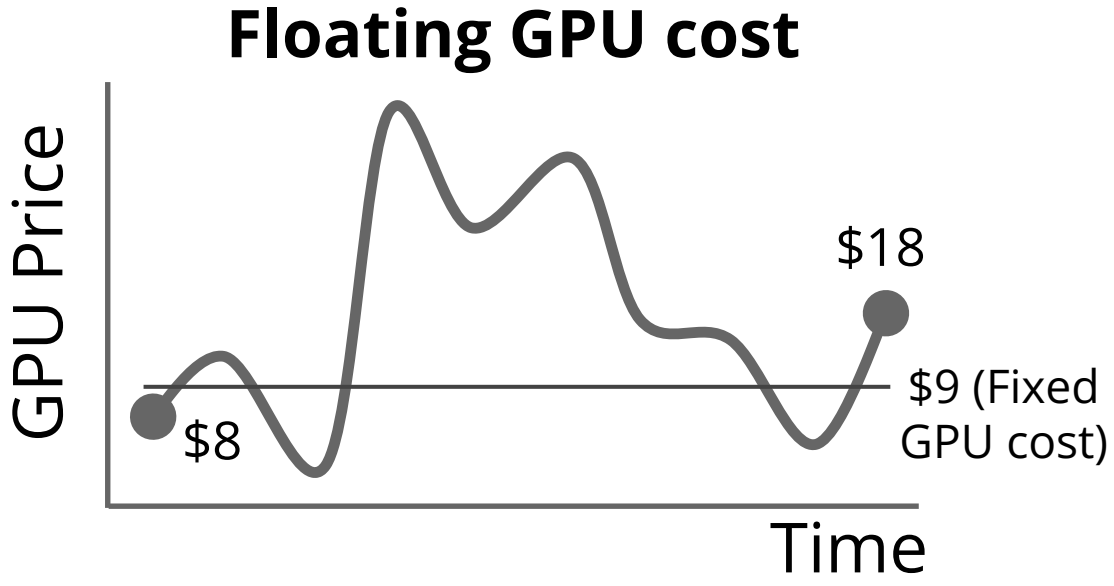

AI developer:
- Uses H100s at **$2**
- Avoids **$6** spike
- Volatility neutralized

# Derivative Instruments

## EXAMPLE: SWAP (FLOATING VS. FIXED LEG)

**GPU Price Swap**

- AI developer pays fixed rate to provider (stable)
- Provider pays floating rate to AI developer (volatile)
- Provider absorbs energy volatility
- Provider is incentivized to be efficient and keep prices lower than $9

**The compute swap allows for decoupling operational risk of data centers from value of output.**

# Building NYSE Core Competency

## USING EXISTING INFRASTRUCTURE

We don’t want to reinvent the wheel…

| Competency | Applied to GPU Market |
|---|---|
| **Price Discovery** | Spot pricing mechanisms for GPU compute |
| **Standardized Contracts** | Defining 1 “unit” of GPU time (e.g. 1 H100-hour) |
| **Clearing & settlement** | Guaranteeing delivery of compute after a trade |
| **Liquidity provision** | Market makers willing to buy/sell GPU futures |
| **Risk management** | Margin requirements, position limits |
| **Order matching** | Bid/ask infrastructure for real-time trading |

# III. Visions for a Compute Exchange

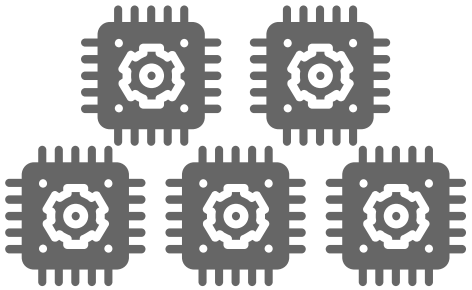

## *C. Standardization of Compute*

# Standardization of Compute

NYSE

## WHAT IS A COMPUTE UNIT?

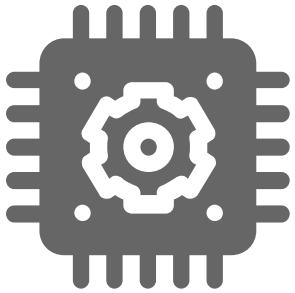

### Motivating Example

**for 1 hour**

*(parallelization overhead)*

<

**for 5 hours**

**Important factors**

- # of GPUs
- Time used
- TFLOPs of work done
- Memory bandwidth

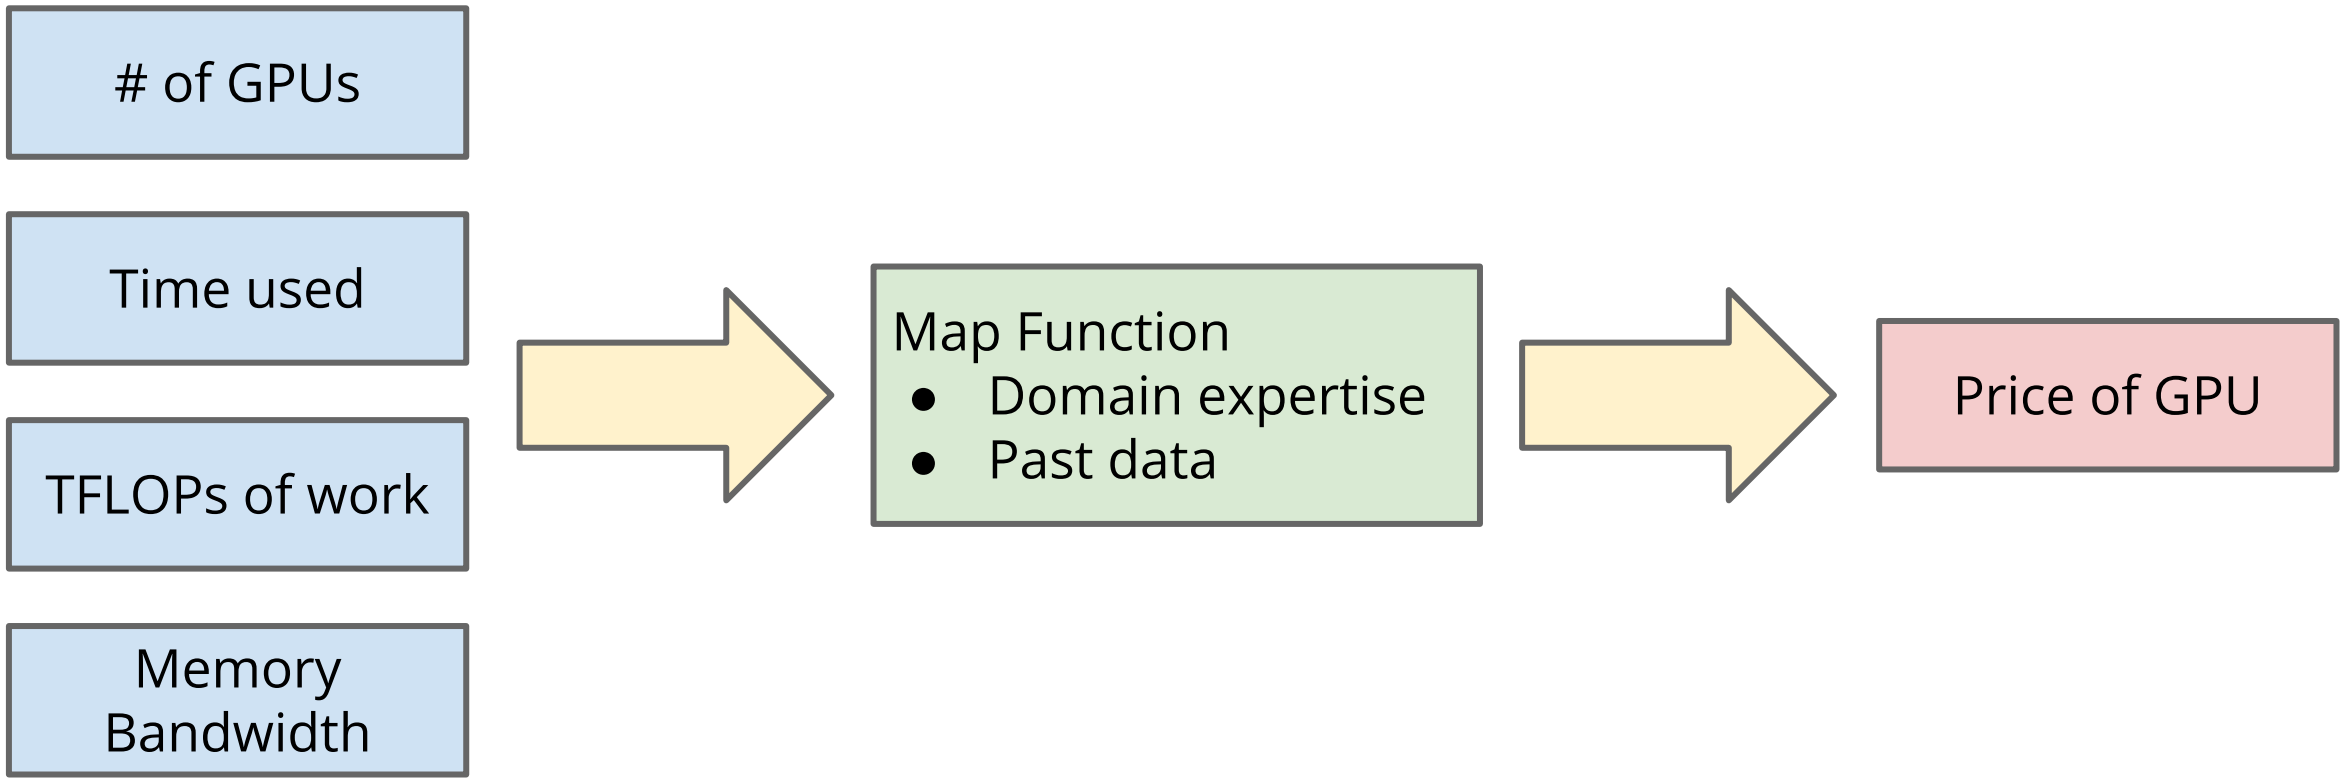

**The major challenge in treating compute as a commodity is standardization.**

# Standardization of Compute

NYSE

## SOLUTION 1: CRAFT A FUNCTION

**Important factors**

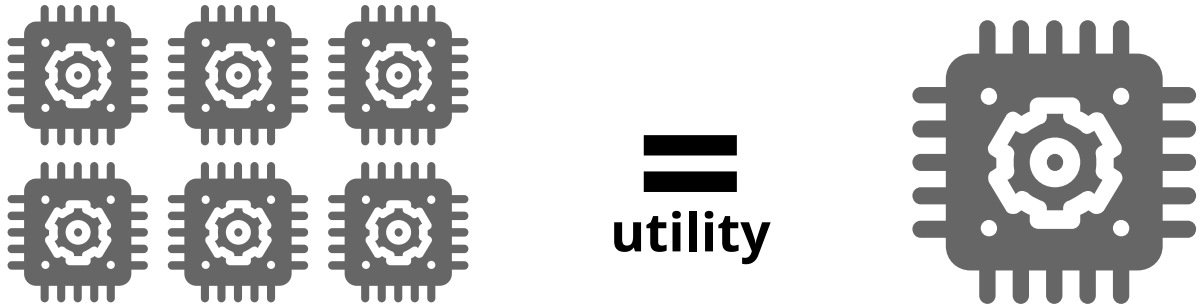

**TFLOPS: tera floating-point operations per second**

# Standardization of Compute

NYSE

## SOLUTION 2: LEAVE THE REGRESSION TO ARBITRAGEURS

**Suppose two forms of compute…**

**for 1 hour**
**$15**

**utility**

**for 5 hours**
**$20**

**≠**

`# Arbitrageur buys` `# Arbitrageur sells`

- Market clears at marginal cost of compute + minimal service fee given to NYSE
- Providers are incentivized to utilize idle capacity that would otherwise be wasted

**The arbitrageur reaps rewards either monetarily or by being able to use compute for cheaper price.**

# IV. Decentralized Exchanges

# Decentralized Exchanges

NYSE

## POTENTIAL DISRUPTOR TO CENTRALIZED EXCHANGE

Centralized Exchange
- Intermediary holds funds
- Fixed trading hours
- Order Matching System
- KYC/AML required
- Regulated
- About 15 bps spot fees

Decentralized Exchange
- Trade directly from wallet
- 24/7
- Smart Contract Execution
- Permissionless
- Unregulated
- About 12 bps spot fees

**DEX spot market share doubled from 6.9% to 13%+ in two years. Monthly volume now exceeds $231B.**

# The Problem with DEXs

NYSE

## STRUCTURAL WEAKNESS: WHY THEY MATTER?

**$2.4B+**

lost through hacks in 1 year

**No KYC/AML compliance**

on most platforms

**100s of block chains**

with fragmented liquidity
**buyers != sellers**

**Institutional capital cannot enter these markets without a trusted regulatory standard.**

# The NYSE Opportunity

## A HYBRID DECENTRALIZED EXCHANGE

NYSE: Regulated Interface
KYC/AML, listing standards, settlement

↓

Decentralized Protocols
Execution, Liquidity, 24/7 Trading

### Revenue Streams

- Listing Fees - Tokens seeking NYSE-regulated legitimacy
- Transaction Fees - Compliant order routing layer
- Data Licensing - Institutional-grade on-chain price feeds
- Compliance-as-a-Service - Regulatory stack for funds wanting DEX exposure

**Capture DEX growth without competing against its permissionless innovation.**

# V. Acknowledgement of Economic Conditions and Potential Risks

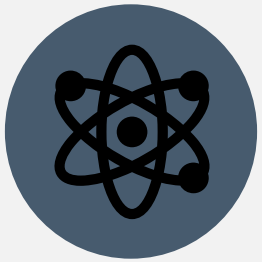

# Macro Risk Landscape

NYSE

## THE AI BUBBLE

A February 2026 NBER study found 90% of firms reporting no measurable productivity impact from AI, and Bill Gurley warned a correction is imminent, making compute derivatives a necessary hedge for the NYSE rather than a speculative bet.

## THE ENERGY CRISIS

Data centers consumed 415 TWh in 2024 with demand projected to double by 2030, strengthening the case for market-based compute pricing to reduce the $44.5 billion wasted annually on idle cloud resources.

## BROADER HEADWINDS

U.S. tariffs have risen from 2% to over 12%, adding an estimated $1,500 tax burden per household in 2026, reinforcing the case for the NYSE to diversify revenue beyond traditional equities.

## Why Incumbents Join the Compute Exchange

- Fixed costs run 10-20x variable costs; idle capacity is pure loss
- Hybrid pricing provably outperforms static pricing (Dierks & Seuken, 2022)
- 20 of 61 studies confirm idle capacity monetization as top provider benefit
- AWS and Azure already run internal spot markets; the exchange standardizes what exists
